

WINTER- 17 EXAMINATION

Subject Name: Theory of Structures

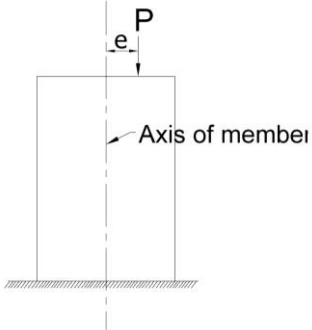

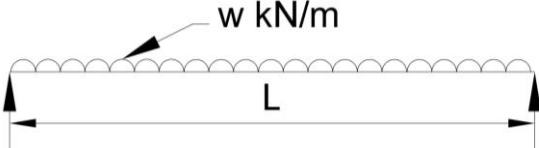

Model Answer

Subject Code:

17422

Important Instructions to examiners:

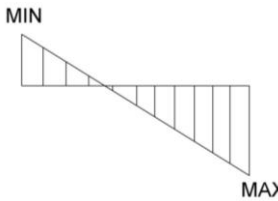

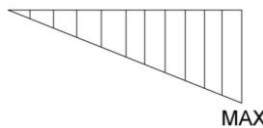

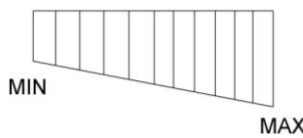

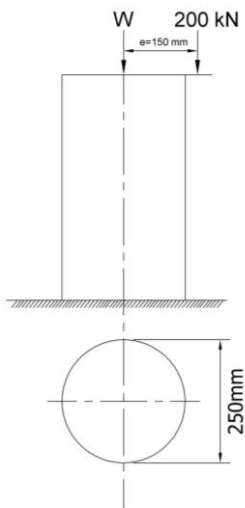

- 1) The answers should be examined by key words and not as word-to-word as given in the model answer scheme.
- 2) The model answer and the answer written by candidate may vary but the examiner may try to assess the understanding level of the candidate.
- 3) The language errors such as grammatical, spelling errors should not be given more Importance (Not applicable for subject English and Communication Skills).
- 4) While assessing figures, examiner may give credit for principal components indicated in the figure. The figures drawn by candidate and model answer may vary. The examiner may give credit for any equivalent figure drawn.
- 5) Credits may be given step wise for numerical problems. In some cases, the assumed constant values may vary and there may be some difference in the candidate's answers and model answer.
- 6) In case of some questions credit may be given by judgement on part of examiner of relevant answer based on candidate's understanding.
- 7) For programming language papers, credit may be given to any other program based on equivalent concept.

Q. No.	Sub Q. N.	Answer	Marking Scheme
Q.1	(A)i) Ans	<p>Define "Eccentric load with neat sketch.</p> <p>Eccentric loading: It is defined as load whose line of action does not coincide with the longitudinal axis of the member.</p> 	01 Mark 01 Mark
Q.1	(A)ii) Ans	<p>Write the values of maximum slope and deflection in case of simply supported beam with u.d.L. over the entire span in terms of EI.</p>  <p>Maximum slope = $(w \times L^3) / (24 \times EI)$ at supports. -----</p> <p>Maximum deflection = $(5 \times w \times L^4) / (384 \times EI)$ at midspan. -----</p>	01 Mark 01 Mark
Q.1	(A)iii) Ans	<p>Write the differential equation for slope and deflection and state terms used in the equation.</p> <p>In the theory of simple bending, curvature of beam is expressed as –</p> $1 / R = d^2y/dx^2$ <p>For bending equation, $1 / R = M / EI$</p>	

		$M / EI = d^2y/dx^2$ $EI(d^2y/dx^2) = M_x$ --- differential equation Where, E = Modulus of elasticity. I = Moment of inertia of C/S. M_x = Bending moment at the section X-X in beam.	01 Mark
			01 Mark
Q.1	(A)iv) Ans	State values of maximum slope and deflection for cantilever beam of span L carrying a point load at free end with meaning of each term. <div style="text-align: center; margin: 10px 0;"> </div>	01 Mark
		Maximum slope = $(WL^2) / 2EI$ at free end ----- Maximum deflection = $(WL^3) / 3EI$ at free end -----	01 Mark
Q.1	(A)v) Ans	State any two disadvantage of fixed beam. <ol style="list-style-type: none"> i. A little sinking of one support over the other induces additional moment at each end. ii. Due to end fixity, temperature stresses are induced due to variation in temperature. iii. Extra care has to be taken to achieve perfect fixity at ends. iv. Frequent fluctuations in loading (moving loads) are likely to disturb end fixity. v. Practically it is difficult to produce 100% fixity. 	Any Two 01 Mark Each
Q.1	(A)vi) Ans	With sketch state the different types of portal frame. <div style="display: flex; justify-content: space-around; align-items: flex-start; margin-top: 10px;"> <div style="text-align: center;"> <p>i. Symmetrical portal frame (Non sway type)</p> </div> <div style="text-align: center;"> <p>ii. Unsymmetrical portal frame (Sway type)</p> </div> </div>	01 Mark each
Q.1	(A)vii) Ans	Define carry over moment and carry over factor. <ol style="list-style-type: none"> i. Carry over moment: It is defined as the moment induced at the far fixed end of beam by the action of the moment applied at the near simply supported or hinged end. ii. Carry over factor: It is the ratio of moment induced at far end to the moment applied at near end without displacing it. 	01 Mark
			01 Mark
Q.1	(A)viii) Ans	List out different types of roof trusses any four. <ol style="list-style-type: none"> i. King post truss ii. Queen post truss iii. Simple fink truss iv. Compound fink truss v. Fan truss vi. Pratt truss vii. Howe truss viii. North light truss 	Any Four ½ Mark each
Q.1	(B)i) Ans	Define core of a section and state middle third rule. <ol style="list-style-type: none"> i. Core of a section: It is defined as the region or area within which if load is applied, produces only compressive resultant stress. ii. Middle third rule: In case of rectangular cross section, if the load is applied at location along the middle third part of both mutually perpendicular axes then the stresses produced are wholly of compressive nature. 	02 Marks
			02 Marks

Q.1	(B)ii) Ans	<p>Draw resultant stress diagram for $\sigma_0 < \sigma_b$, $\sigma_0 = \sigma_b$, $\sigma_0 > \sigma_b$.</p> <div style="display: flex; justify-content: space-around; align-items: flex-start;"> <div style="text-align: center;"> <p>i) $\sigma_0 < \sigma_b$</p>  </div> <div style="text-align: center;"> <p>ii) $\sigma_0 = \sigma_b$</p>  </div> <div style="text-align: center;"> <p>iii) $\sigma_0 > \sigma_b$</p>  </div> </div> <p>Where, σ_0 = Direct stress and σ_b = Bending stress -----</p>	01 Mark each for dia. 01 Mark	
Q.1	(B)iii) Ans	<p>a) State the assumptions in the analysis of frame.</p> <ol style="list-style-type: none"> 1. All joints in frame are pinned or hinged. 2. Loads are applied at joints only. 3. Self-weight of members of frame is neglected. 4. Only axial forces (tensile and compressive) are induced in the member. <p>b) Define redundant frame and state its condition.</p> <p>Redundant frame: It is the frame which cannot be analysed internally using basic equations of equilibrium ($\sum M_A = 0$, $\sum F_x = 0$ and $\sum F_y = 0$).</p> <p>Condition: $m > (2j - 3)$ where, m = Number of members and j = No. of joints.</p>	½ mark for each 01 Mark 01 Mark	
Q.2	a) Ans	<p>A solid circular column of diameter 250 mm carries an axial load 'W' kN and a load of 200 kN at an eccentricity of 150mm. Calculate minimum value of 'W' so as to avoid the tensile stresses at base.</p> <p>$A = (\pi \times 250^2) / 4 = 49087.38 \text{ mm}^2$</p> <p>$M = P \times e = 200 \times 10^3 \times 150 = 3 \times 10^7 \text{ N-mm}$</p> <p>$I = (\pi \times 250^4) / 64 = 1.917 \times 10^8 \text{ mm}^4$</p> <p>$y = D / 2 = 250 / 2 = 125 \text{ mm.}$</p> <p>$\sigma_0 = (W + P) / A = (W + 200 \times 10^3) / 49087.38$</p> <p>$\sigma_b = (M \times y) / I = 3 \times 10^7 \times 125 / 1.917 \times 10^8$ $= 19.562 \text{ N/mm}^2$</p> <p>For no tension, $\sigma_0 = \sigma_b$ $(W + 200 \times 10^3) / 49087.38 = 19.562$ $W = 760238.3 \text{ N} = 760.24 \text{ kN.}$</p>		01 Mark 01 Mark 01 Mark 01 Mark

Q.3	e) Ans	<p>Explain imperfect and perfect frame in detail.</p> <p>Perfect frame: It is the simple frame in which number of joints (j) and number of members (m) satisfies the equation $m = 2j - 3$. Such frames are internally determinate i.e. can be analysed by using basic equations of equilibrium ($\Sigma M_A = 0$, $\Sigma F_x = 0$ and $\Sigma F_y = 0$).</p>		02 Marks

Imperfect frame: It is the simple frame in which number of joints (j) and number of members (m) does not satisfy the equation $m = 2j - 3$. Such frames are internally indeterminate/redundant or deficient.
 If $m > 2j - 3$; then frame is called as indeterminate/redundant frame and cannot be analysed by using basic equations of equilibrium ($\Sigma M_A = 0$, $\Sigma F_x = 0$ and $\Sigma F_y = 0$).
 If $m < 2j - 3$; then frame is called as deficient frame and it is unstable frame.

02 Marks

Q.3 f)

Determine the forces along with nature in the members AB, AE, EB and EF for frame subjected to a load as shown is Fig. using method of joints.

Ans

Consider joint A.

$$\theta = \tan^{-1}(0.5/2) = 14.04^\circ$$

Assuming F_{AE} and F_{AB} both tensile.

$$\Sigma F_y = 0; \quad 2 + F_{AB} \sin 14.04 = 0$$

$$F_{AB} = -2 / \sin 14.04 = -8.24 \text{ i.e. } 8.24 \text{ kN (Compressive)}$$

$$\Sigma F_x = 0; \quad -F_{AE} - F_{AB} \cos 14.04 = 0$$

$$-F_{AE} - (-8.24) \cos 14.04 = 0$$

$$F_{AE} = 8.0 \text{ kN (Tensile)}$$

Consider joint E.

Assuming F_{EF} and F_{EB} both tensile.

$$\Sigma F_x = 0; \quad -F_{EF} + 8.0 = 0$$

$$F_{EF} = 8.0 \text{ kN (Tensile)}$$

$$\Sigma F_y = 0; \quad -6.0 - F_{EB} = 0$$

$$F_{EB} = -6.0 \text{ i.e. } 6.0 \text{ kN (Compressive)}$$

Q.4	a)	<p>State Clapeyron's theorem and also write the Clapeyron's three moment theorem for beam with different moment of inertia giving meaning of each term.</p> <p>Ans. Clapeyrons theorem: For two span continuous beam having uniform moment of inertia supported at A, B, and C and subjected to any external loading, the support moments M_A, M_B and M_C at the supports A, B and C respectively are given by the relation, $M_A \times L_1 + 2M_B(L_1 + L_2) + M_C \times L_2 = - [(6 \times a_1 \times x_1/L_1) + (6 \times a_2 \times x_2/L_2)]$</p> <div style="text-align: center;"> </div> <p>If moment of inertia is not constant then Clapeyrons theorem can be stated in form of following equation. $M_A \times (L_1/l_1) + 2M_B[(L_1/l_1) + (L_2/l_2)] + M_C \times (L_2/l_2) = - [(6 \times a_1 \times x_1/L_1l_1) + (6 \times a_2 \times x_2/L_2l_2)]$ Where, L_1 & L_2 are length of span AB & BC resp. l_1 & l_2 are Moment of inertia of span AB & BC resp. a_1 & a_2 are area of simply supported BMD of span AB & BC resp. x_1 & x_2 are distances of centroid of simply supported BMD from A & C resp.</p>	02 Marks
Q.4	b)	<p>Explain the concept of imaginary zero span in case of Clapeyron's theorem.</p> <p>When the ends of continuous beam are fixed, then an imaginary span is considered to the left or right of the fixed support as the case may be and Clapeyrons theorem is applied to the imaginary span and its adjescent span as per regular procedure.</p> <p>If left end is fixed then consider imaginary span left of this support and If right end is fixed then consider imaginary span on right side of that support.</p> <p>Clapeyrons theorem is applied as below.</p> <div style="text-align: center;"> </div> <p>A_0-A is imaginary span left to fixed end A. For span A_0-A and AB $M_{A_0} \times L_0 + 2M_A(L_0 + L_1) + M_B \times L_1 = - [(6 \times a_0 \times x_0/L_0) + (6 \times a_1 \times x_1/L_1)]$ $0 + 2M_A(L_1) + M_B \times L_1 = - [0 + (6 \times a_1 \times x_1/L_1)]$ Where M_{A_0}, L_0 and x_0 are terms related to imaginary span.</p>	02 Marks

Q.5

c)

Using method of section find forces in members BC, BE and EF and EC for truss shown in Fig. State nature of forces tabulate results.

Reactions:

$$\sum M_A = 0 = 50 \times 3 - 10 \times 3 - R_D \times 9$$

$$R_D = 13.33 \text{ kN}$$

$$R_{AV} = 50 - 13.33 = 36.67 \text{ kN}$$

$$\sum F_V = 0$$

$$R_{AH} - 10 = 0$$

$$R_{AH} = 10 \text{ kN}$$

Taking section along EF, EC and BC

Assuming all forces Tensile

Taking moment @ C;

$$- 13.33 \times 3 - 10 \times 10 - F_{EF} \times 3 = 0$$

$$F_{EF} = -23.33 \text{ i.e. } 23.33 \text{ kN (Compressive)}$$

Taking moment @ E;

$$F_{CB} \times 3 - 13.33 \times 6 = 0$$

$$F_{CB} = 26.67 \text{ kN (Tensile)}$$

$$\sum F_V = 0 = 13.33 + F_{CE} \sin 45$$

$$F_{CE} = -18.85 \text{ i.e. } 18.85 \text{ kN (Compressive)}$$

Taking section along EF, EC, EB and BA

$$\sum F_V = 0 = 13.33 - 18.85 \sin 45 + F_{BE}$$

$$F_{BE} = 0$$

Q.6

a)

A simply supported beam of 6 m span carries an u.d.l. of 20 kN/m over entire beam and a point load of 60 kN at 2 m from right hand support using Macaulay's method, locate the point of maximum deflection and find its value in terms of EI.

Ans

Reactions:

$$\sum M_A = 0$$

$$60 \times 4 + 20 \times 6 \times 3 - R_B \times 6 = 0$$

$$R_B = (240 + 360) / 6$$

$$= 100 \text{ kN.}$$

$$R_A = 20 \times 6 + 60 - 100 = 80 \text{ kN.}$$

Taking section X-X at distance 'x' from B.

$$M_x = 100 \times x - 60(x - 2) - 20 \times x^2/2$$

$$EI d^2y/dx^2 = -M_x$$

$$= -100 \times x + 60(x - 2) + 20 \times x^2/2$$

Integrating

$$EI dy/dx = (-100 \times x^2/2) + [60(x - 2)^2/2] + 10 \times x^3/3 + C_1 \text{ ----- 1}$$

Integrating

$$EI y = (-50 \times x^3/3) + [30(x - 2)^3/3] + 10 \times x^4/12 + C_1 x + C_2 \text{ ----- 2}$$

At $x = 0$; $y = 0$ in eqⁿ. 2

$$0 = 0 + C_2$$

$$C_2 = 0$$

At $x = 6$; $y = 0$ in eqⁿ. 2

$$0 = (-50 \times 6^3/3) + [30(6 - 2)^3/3] + 10 \times 6^4/12 + C_1 \times 6 + C_2$$

$$C_1 = 313.33$$

Hence $C_1 = 313.33$ and $C_2 = 0$

Slope equation:

$$dy/dx = 1/EI(-50 \times x^2) + [30(x - 2)^2] + 10 \times x^3/3 + 313.33 \text{ ----- I}$$

Deflection equation:

$$y = 1/EI(-50 \times x^3/3) + [10(x - 2)^3] + 10 \times x^4/12 + 313.33x \text{ ----- II}$$

Deflection is maximum where slope changes the sign i.e. slope = 0

Maximum deflection will be in between A and C

Hence, $6 > x > 2$

Equating Equⁿ I with zero.

$$0 = 1/EI(-50 \times x^2) + [30(x - 2)^2] + 10 \times x^3/3 + 313.33$$

$$= -50 \times x^2 + 30x^2 - 120x + 120 + 10 \times x^3/3 + 313.33$$

01 Mark

01 Mark

01 Mark

01 Mark

01 Mark

01 Mark

$$0 = -20x^2 - 120x + 3.33x^3 + 433.33$$

Solving this equation by trial and error method.

$$x = 2.89 \text{ m}$$

Hence deflection is maximum at distance 2.89 m from B

For y_{\max} , put $x = 2.89$ in equⁿ II

$$y_{\max} = \frac{1}{EI}(-50 \times 2.89^3/3) + [10(2.89 - 2)^3] + 10 \times 2.89^4/12 + 313.33 \times 2.89$$

$$= 568.4 / EI$$

01 Mark

01 Mark

Q.6 b) A fixed beam of span 8 m carries 5 kN/m udl over entire length along with a point load of 40 kN at 2m from left hand support. Find net BM at point load and draw BMD and SFD.

Ans

$$M_{AB} = (40 \times 2 \times 6^2 / 8^2) + (5 \times 8^2 / 12)$$

$$= 71.67 \text{ kN-m}$$

$$M_{BA} = (40 \times 2^2 \times 6 / 8^2) + (5 \times 8^2 / 12)$$

$$= 41.67 \text{ kN-m}$$

Reactions:

$$\Sigma M_A = 0$$

$$40 \times 2 + 5 \times 8 \times 4 + 41.67 - 71.67 - R_B \times 8 = 0$$

$$R_B = (80 + 160 - 30) / 8$$

$$= 26.25 \text{ kN.}$$

$$R_A = 5 \times 8 + 40 - 26.25 = 53.75 \text{ kN.}$$

Bending moment at point load

$$M_C = -71.67 + 53.75 \times 2 - 5 \times 2 \times 1$$

$$= 25.83 \text{ kN-m}$$

Shear force calculations:

$$\text{At B} = -26.25 \text{ kN}$$

$$\text{At C, just right} = -26.25 + 5 \times 6 = 3.75 \text{ kN}$$

$$\text{At C, just left} = -26.25 + 5 \times 6 + 40 = 43.75 \text{ kN}$$

$$\text{At D} = 53.75 \text{ kN}$$

Q.6 c) A beam ABCD is supported at A, B and C, CD being overhang AB = 4 m, BC = 5 m and CD = 1m AB and BC carries a central point of 15kN and 12kN respectively and a point load Of 6 kN at D. Calculate support moments using three moment theorem and draw SFD and BMD giving net BM.

Ans

01 Mark

$$M_1 = 15 \times 4/4 = 15.0 \text{ kN-m}$$

$$a_1 = 0.5 \times 4 \times 15 = 30.0$$

$$x_1 = 4/2 = 2.0 \text{ m}$$

$$M_2 = 12 \times 5/4 = 15.0 \text{ kN-m}$$

$$a_2 = 0.5 \times 5 \times 15 = 37.5$$

$$x_2 = 5/2 = 2.5 \text{ m}$$

Using three moment theorem;

$$M_A \times l_1 + 2M_B (l_1 + l_2) + M_C \times l_2 = - [(6 \times a_1 \times x_1/l_1) + 6 \times a_2 \times x_2/l_2]$$

$$M_A = (\text{End simple supports})$$

$$M_C = -6 \times 1 = -6.0 \text{ kN-m}$$

$$2M_B(4 + 5) - 6 \times 5 = - [(6 \times 30.0 \times 2.0/4) + 6 \times 37.5 \times 2.5/5]$$

$$18.0M_B = -90.0 - 112.5 + 30$$

$$M_B = -172.5/18 = -9.583 \text{ i.e. } 9.583 \text{ kN-m Hogging}$$

Reactions:

$$R_A = (15 \times 2 - 9.583) / 4 = 5.1 \text{ kN.}$$

$$R_C = (12 \times 2.5 + 6 \times 6 - 9.583) / 5 = 11.28 \text{ kN.}$$

$$R_B = 15 + 12 + 6 - 11.28 - 5.1 = 16.62 \text{ kN.}$$

Net bending moments:

$$\text{Under } 15 \text{ kN load} = 15 - (9.583/2) = 10.21 \text{ kN-m}$$

$$\text{Under } 12 \text{ kN load} = 15 - [(9.583 + 6)/2] = 7.21 \text{ kN-m.}$$

Shear force calculations:

$$\text{At D} = 6 \text{ kN}$$

$$\text{At C, right} = 6.0 \text{ kN}$$

$$\text{At C, left} = 6.0 - 11.28 = -5.28 \text{ kN}$$

$$\text{At } 12 \text{ kN load, right} = -5.28 \text{ kN}$$

$$\text{At } 12 \text{ kN load, left} = -5.28 + 12 = 6.72 \text{ kN}$$

$$\text{At B, right} = 6.72 \text{ kN}$$

$$\text{At B, left} = 6.72 - 16.62 = -9.9 \text{ kN}$$

$$\text{At } 15 \text{ kN load, right} = -9.9 \text{ kN}$$

$$\text{At } 15 \text{ kN load, left} = -9.9 + 15 = 5.1 \text{ kN}$$

$$\text{At A} = 5.1 \text{ kN}$$
